## Troll Biology

## Worldbuilding

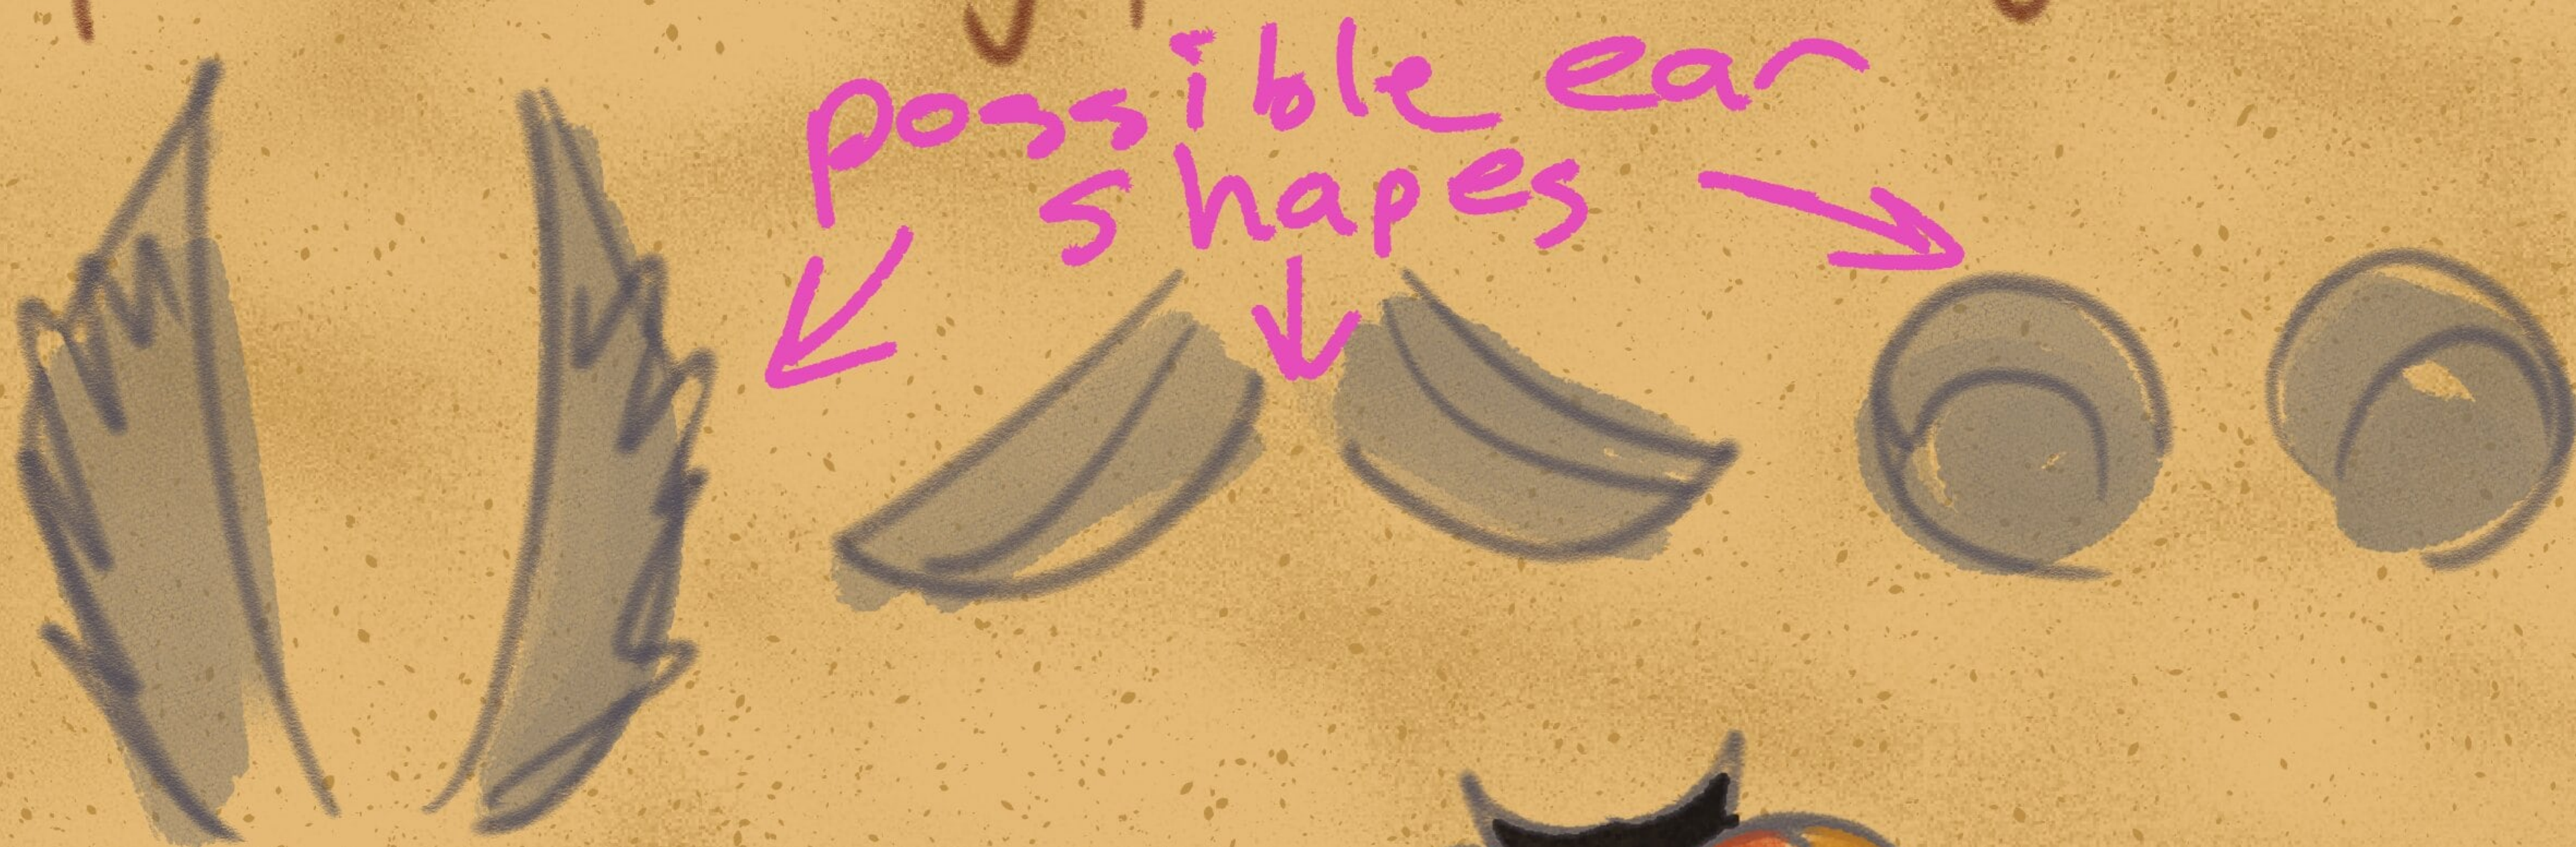

## Notes

(For our MSPEA)

## Group II: "Burgundy"

While they are the most populous of all bloodlines, "Rustbloods" do not stand out as particularly strong or useful. They have thick horns that curl up and away from the eyes.

All undesirable specimen are designated as "rusted!"

## Group 8: "Olive"

Olives are much hairier compared to other trolls, along with having more vestigial organs. Olivebloods are almost always born with a long, furry tail and their ears are on top of their heads, close to their horns.

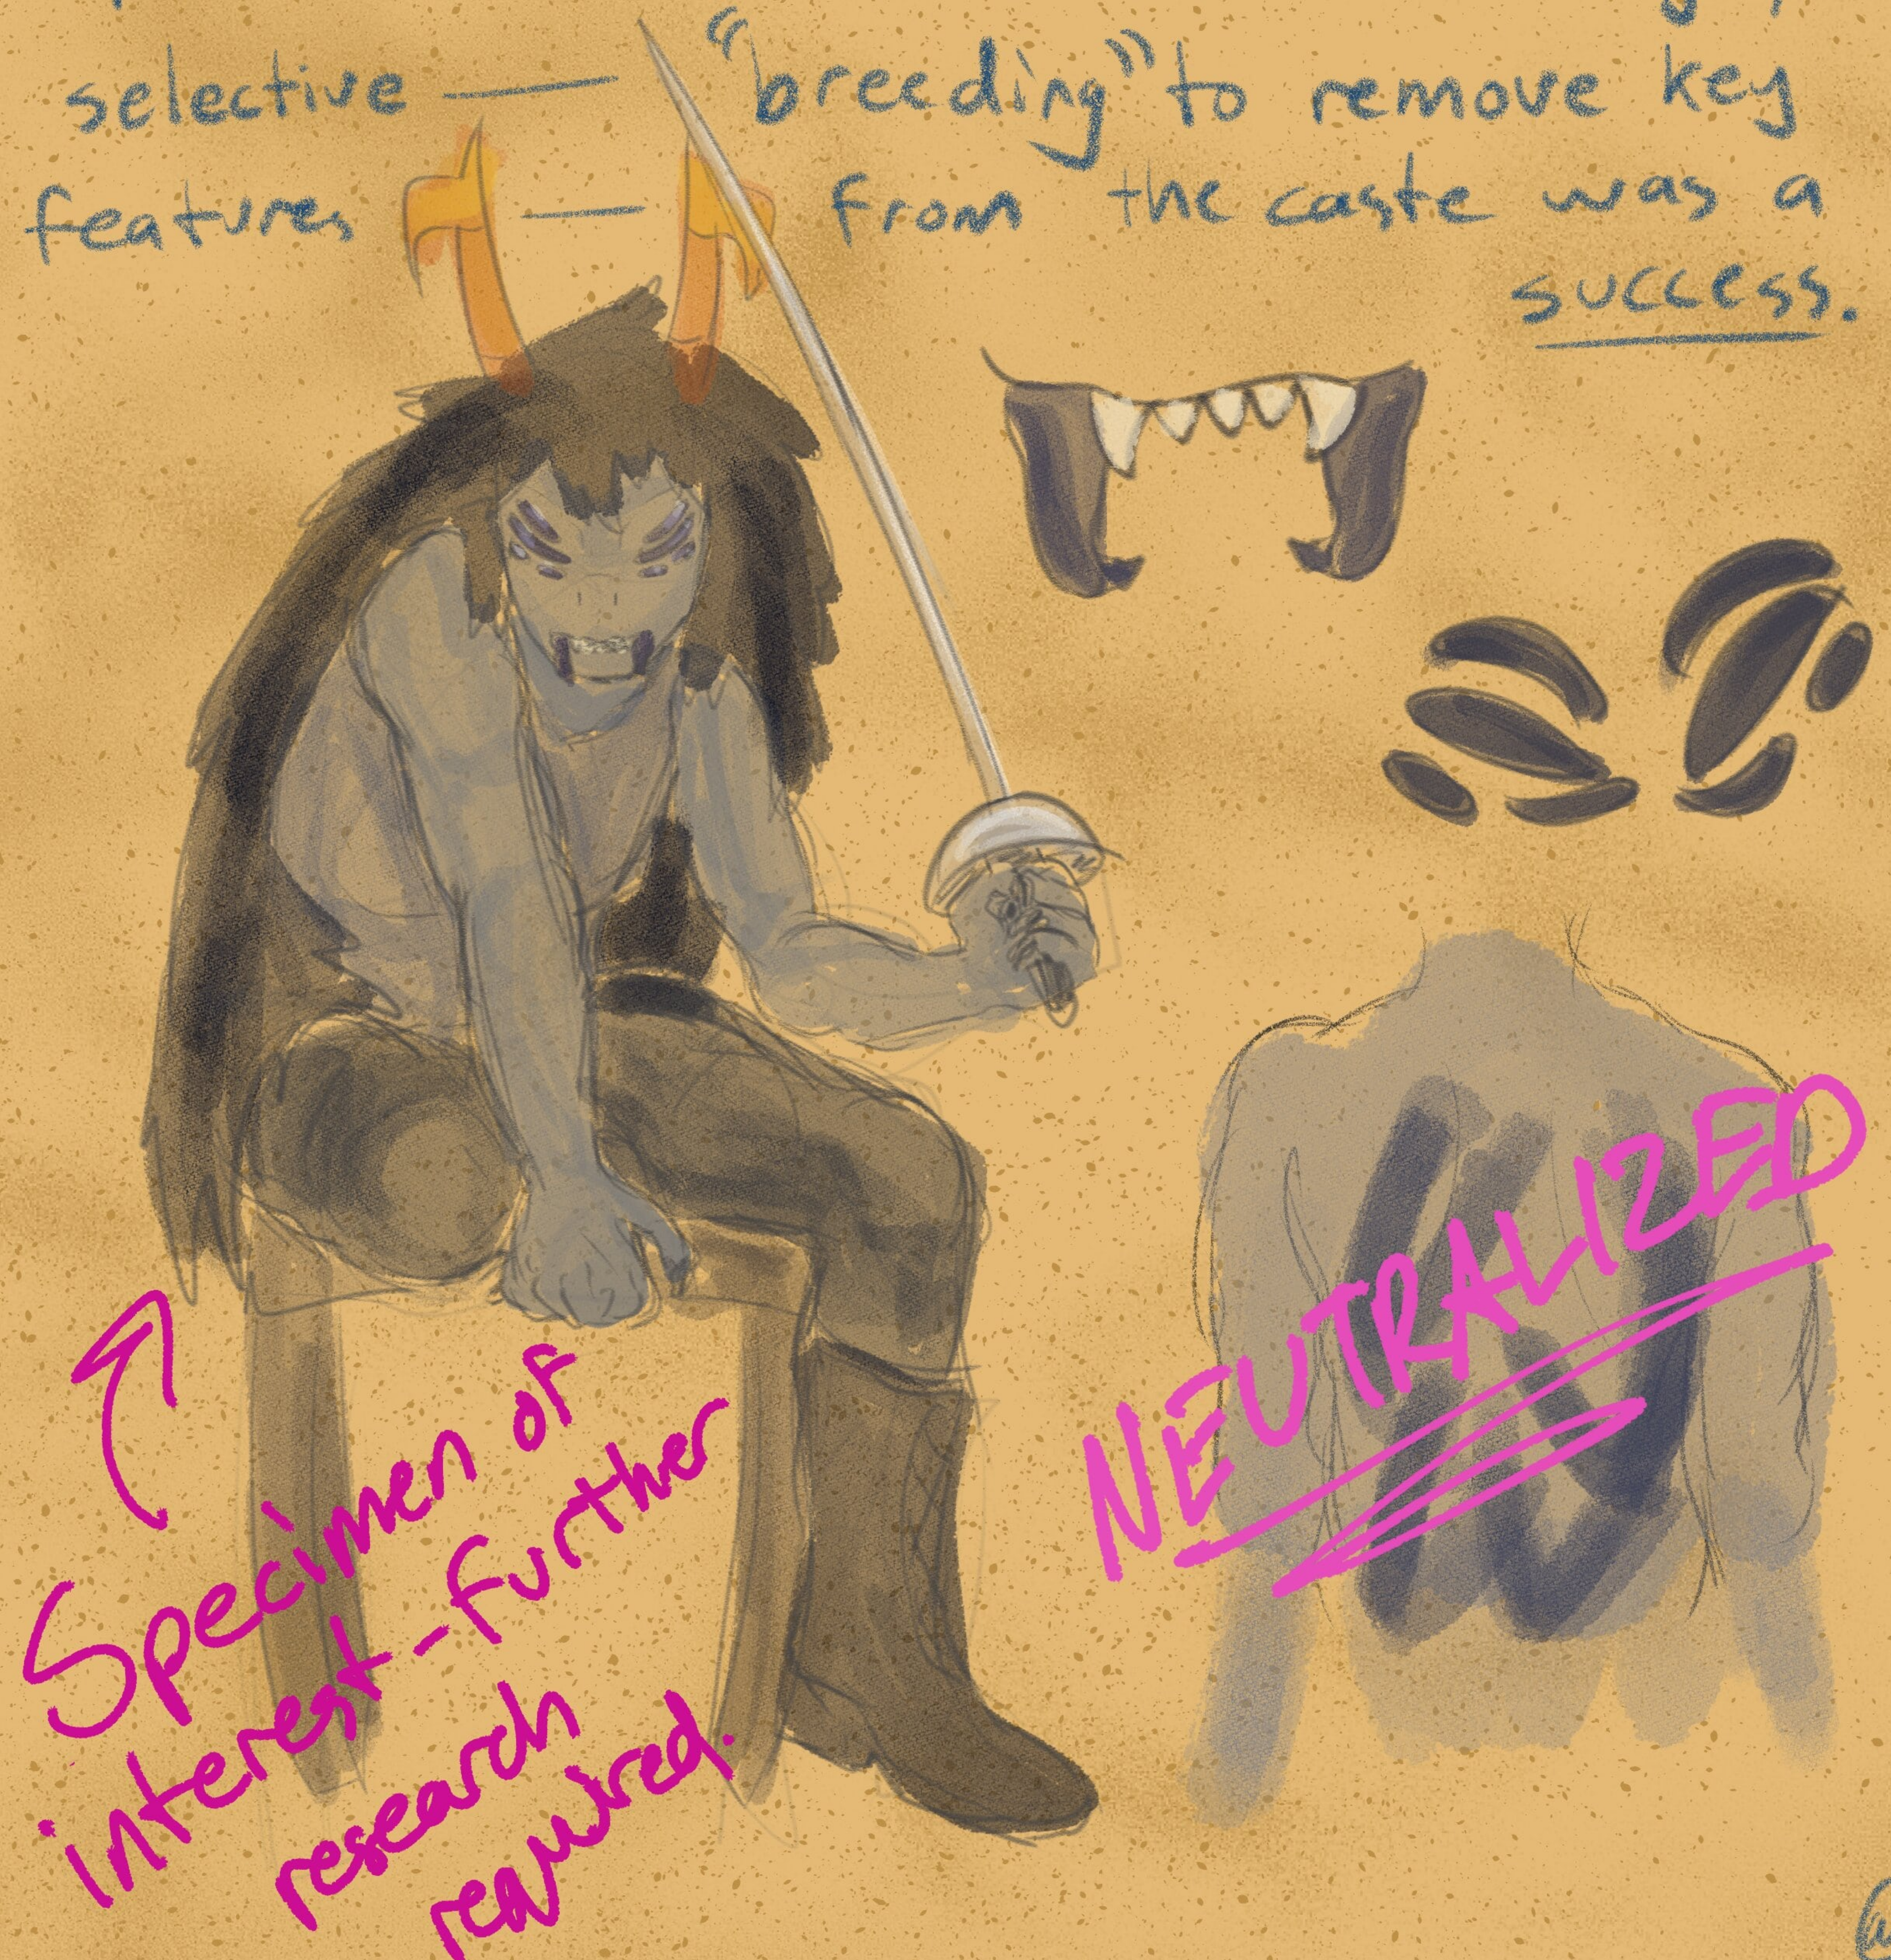

Permanent  
removal research  
in progress

# Group 5: "Cerulean"

We have designated specimen of arthropodal stature the first in the "highblood" group. The specimen shown is of arachnid origin, and selective — "breeding" to remove key features — from the caste was a success.

## Group 4: "Indigo"

Indigo experimentation has proven to be the most successful out of all blood castes. Most of their ungulate features have been neutralized.

All Indigos are required to undergo Steed training at the age of 15, a protocol we have experienced very little resistance to.

~~NEUTRALIZED~~
